

## Rear view Hunting Mirror

### Abstract of the Disclosure

A rear view hunting mirror which is characterized by a mirror mounted on one end of a flexible “gooseneck” coupling, with a curved mount bracket attached to the opposite end of the flexible coupling and fitted with an adjustable mount strap and buckle combination for attaching the rear view hunting mirror to a post, tree or a tree limb. The mirror can then be manipulated into position in front of a hunter in the tree or a hunter positioned on a tree stand attached to the tree or post, for viewing the area behind the hunter and spotting game in that area. A camouflage sheath can be fitted over the flexible coupling to aid in camouflaging the rear view hunting mirror from deer and other game. The flexible coupling has multiple, removable coupling digits connected in a friction-fit and attached to the mirror and to the bracket to facilitate a flexible coupling of desired length.
